

## font management

### who should use a font management program?

Whether you are a Windows or Macintosh user with beginner or advanced font management requirements, there's a font management program that will suit your needs. Having greater control and features such as detection and repair of corrupt fonts, missing fonts, duplicate fonts, and PostScript errors means more time being creative and less time troubleshooting system performance issues.

### why is font management important?

Whether you run a one-person design firm, or work in a large organization, you know how important fonts are and how difficult they can be to manage. Did you know that a lack of proper font management can lead to system performance issues? In fact, corrupt, missing, or duplicate fonts can bring your whole system to a halt.

When you have control of your fonts, you can find the font you want with ease, and work more efficiently. And the ability to deactivate unneeded fonts helps your computer perform better when you have an extensive collection of fonts installed.

### what are the benefits of font management?

- + Consistent font usage across workgroups
- + Tighter control of fonts in your workflow
- + Elimination of font conflicts and rogue fonts
- + Decrease in font-related help desk tickets
- + Secure font storage
- + Sort and find fonts by attributes (style, foundry, class, etc.)
- + Easily address missing fonts and font conflicts
- + Repair corrupt fonts; clean font caches

### why should I choose Loop?

Loop's team of specialists can help determine the best option to manage fonts based on your workflow requirements, can implement the solution, and then train your team on how to easily and quickly access fonts when and where they're needed.
